

Automatically update card members' data

Industry: Finance/Credit card

HULFT

Purpose of introducing HULFT products

Reduce work-hours, eliminate errors from counting, and ensure security through the automation of the daily and monthly update of members' data. Also ensure safety in data integration.

Issues prior to introducing HULFT products

Real-time point processing was systemized early on. However, daily and monthly members' data were handled by attaching an Excel file to an email. This meant 5 work-days/month for data aggregation on the Excel file and for preparing and handling emails. The work was completely dependent on the skills of the individual.

Effect of introducing HULFT products

The risk of information leakage and work-hours has been reduced, eliminating the need to recover from mistakes in the handling of daily and monthly data. As a result, there has been a drastic reduction in the number of overtime hours worked by the person assigned to handle this.
