Personal Information Retrieval System

Personal Information about Temporary Employees

Employers (Client Companies)

Purpose of introducing HULFT products

To build a site on Amazon Web Services, on which information about employees registered with the agency can be retrieved. To establish a secure and safe infrastructure for dealing with personal information by linking the on-premise environment with the cloud service.

Issues prior to introducing HULFT products

The information sent and received between the agency and contracted client companies includes personal information about employees registered with the agency. Because this information was sent via email attachments, security was a concern.

Effect of introducing HULFT products

Client companies are now able to securely browse the employment agency's information on the cloud service. As a result, client satisfaction has greatly increased.
