

# Quickly develop an integration master

Industry: Manufacturing/Food manufacturing and sales

## Purpose of introducing HULFT products

Store the operation systems' master data to the integrated master database. Send data from the integration master to the operation systems that are linked with it. Use this approach to automate the process for updating the master information.

## Issues prior to introducing HULFT products

The integration master must be developed within a three-month period. The coding practice slightly varies among the members of the development team, which results in poor productivity and a higher overall development cost.

## Effect of introducing HULFT products

The GUI development environment eliminates most of the coding-based development work. Development can be completed within one-fourth of the expected work-hours for development from scratch. This has significantly helped reduce development costs.
