Solution

Integrating work attendance data and vehicle dispatch management systems for utilization in the automation of cost-cutting for employee shuttle bus services

Solution overview

pi-po attendance management

Mii Hawk vehicle dispatch management

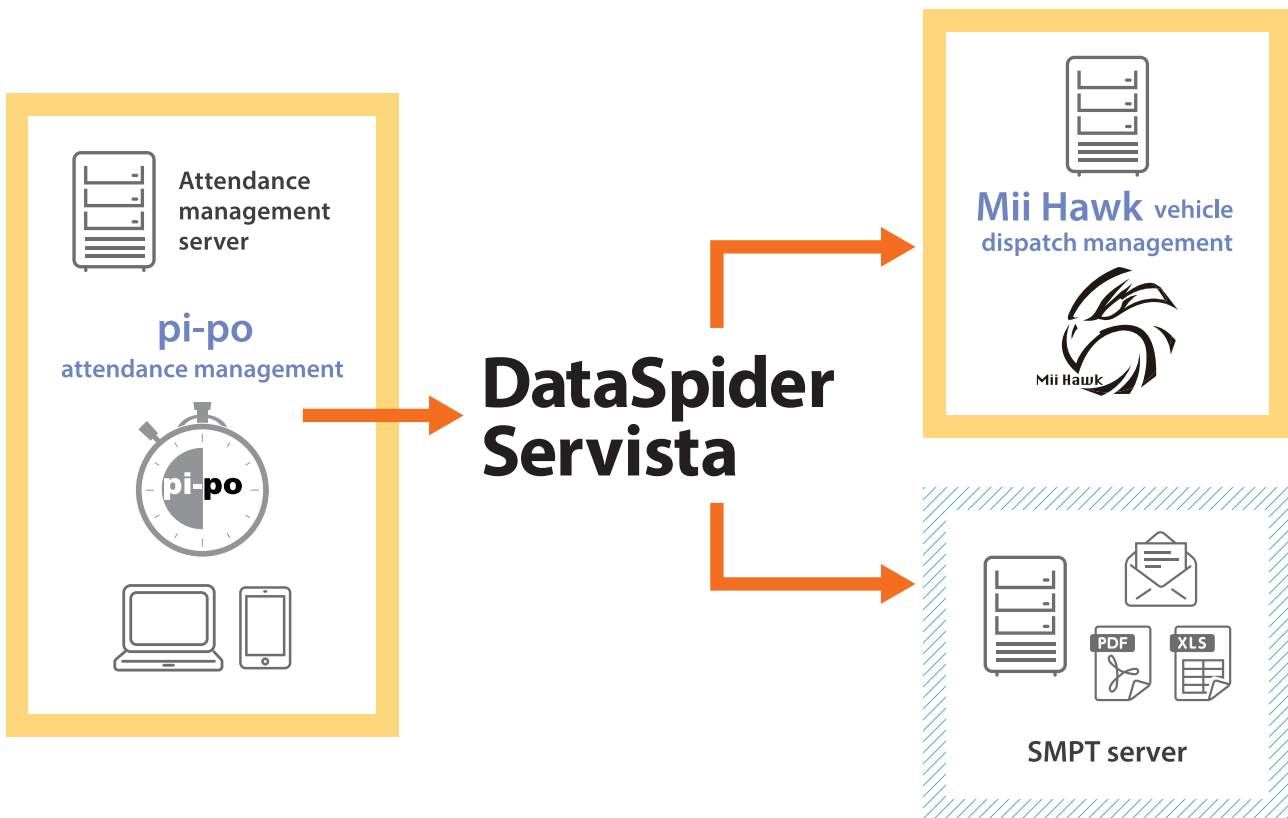

DataSpider Servista

Mii Hawk (vehicle dispatch management) and pi-po (mobile attendance management) systems are provided to companies in Thailand using vehicles such as shuttle buses and vans to provide transportation for 100 or more employees. For companies with large numbers of employees, the monthly cost of these shuttle services approaches 100 million yen.

Optimization simulations using Mii Hawk can achieve cost reductions of nearly 40% by performing calculations based on work attendance data, offering companies a powerful way to reduce shuttling costs. However, Mii Hawk has no attendance management functionality of its own, and in the past attendance management data had to be imported manually.

DataSpider enables automated integration with attendance data from pi-po. Additionally, reports output using Mii Hawk can be used to arrange and issue instructions to buses and vans for the same day by sending e-mails to shuttle bus service companies, removing the risk of forgotten tasks and operational misses.

DataSpider Servista enables easy integration between systems!
