# Integrating Data with Client Companies on a Public Cloud Service

Industry: Service - Research

Purpose of introducing HULFT products

To quickly and inexpensively establish a secure infrastructure for the integration of data, through which confidential information such as personal information can be shared with client companies.

Issues prior to introducing HULFT products

The company was concerned about the risks associated with direct connections to client companies' systems. Time-consuming tasks were required to ensure the integrity of data when files were transferred, and the processing required to recover from a failure was a hassle.

Effect of introducing HULFT products

By setting up a relay server to function as a proxy, the company greatly increased the level of security for data integration. The number of labor hours required for data transfer decreased dramatically, and the integrity of data is now ensured, even when a failure occurs.
